

# WHERE IN THE WORLD ARE SELF-DRIVING CARS?

Transportation as we know it is starting to change with the proliferation of self-driving vehicles and technology developed by high-profile companies. This is becoming more evident with new testing sites on public roads and closed courses popping up across the globe every month.

The United States has been at the forefront of the autonomous-vehicle live trial movement, with more than half a dozen sites already in operation. Europe moved first with controlled-environment testing, and is focusing mainly on public transportation projects. In Asia, there are three testing locations with plans for expansion. Late in 2016, the first Canadian testing of self-driving vehicles began in Ontario.

This map charts the current self-driving vehicle testing and deployment locations worldwide.
